New Standards of Care

New Value Propositions, Delivery Channels and Business Models

Personalized Medicine: Competing Claims

- many physicians believe they already do it
- personalized medicine is just hype
- personalized medicine threatens many established constituencies in the current healthcare ecosystem
- personalized medicine will be so expensive as to be unaffordable
- personalized medicine is the logical, inevitable outcome of understanding disease at the level of alterations in molecular information networks
- personalized medicine represents the intellectual foundation for rational care, improved outcomes and cost control

Reactive, Episodic and Fragmented Healthcare Delivery: Symptoms-Based, Erratic Paper Records and Medical Paternalism

IOM Committee Will Probe Duke Scandal Together With Other "Omics" Case Studies

By Paul Goldberg

A committee of the Institute of Medicine will refrain from launching a police-style investigation of the Duke scandal, the group's chairman said.

"We are not an investigative body," said Gilbert Omenn, director of the University of Michigan Center for Computational Medicine and Biology and chairman of the IOM committee. "I think we are heading into a morass, to try to figure out what really happened at Duke and who should bear responsibility and who should be held accountable."

At its first meeting Dec. 20, the 19-member group struggled publicly to interpret its charge and design a plan for deriving science policy lessons

Sloppy Science and Inadequate Reproducibility

"There is no 'bad ingredient central clearinghouse'
where one can report analyte failures.
Maybe we need an 'Angie's List'
for antibodies and cell lines."

"Underlying everything else:
a system that encourages getting published first
rather than getting the science right
In short, a system based on shortcuts".

Dr. George W. Sledge, Jr.
Indiana University Simon Cancer Center,
Past President, ASCO
Oncology Times, 25 May 2012, p. 28

REPRODUCIBILITY INITIATIVE

"The N of One: The Large N" Dilemma in High Dimensionality Biomarker Profiling

N of One

- individualized patient biomarker profiling for clinical diagnostic subtyping and/or Rx selection for *validated* biomarker

Large N

- validation of *putative* marker(s) requires large, statistically powered sample sets
  - high dimensionality markers (10^3 - 10^6)/WGS using very small sample sets (10^1 - 10^2) results in inevitable overfitting
  - large N of 10^3 - 10^4 samples needed for robust validation cohorts
  - logistics and cost of screening candidate pool for low frequency markers (e.g., ALK, ROS in NSCLC)

Access to High Quality Biospecimens, Biobanks and DNA Repositories: An Obligate Prerequisite to Productive Validation of Putative Causal Disease Markers

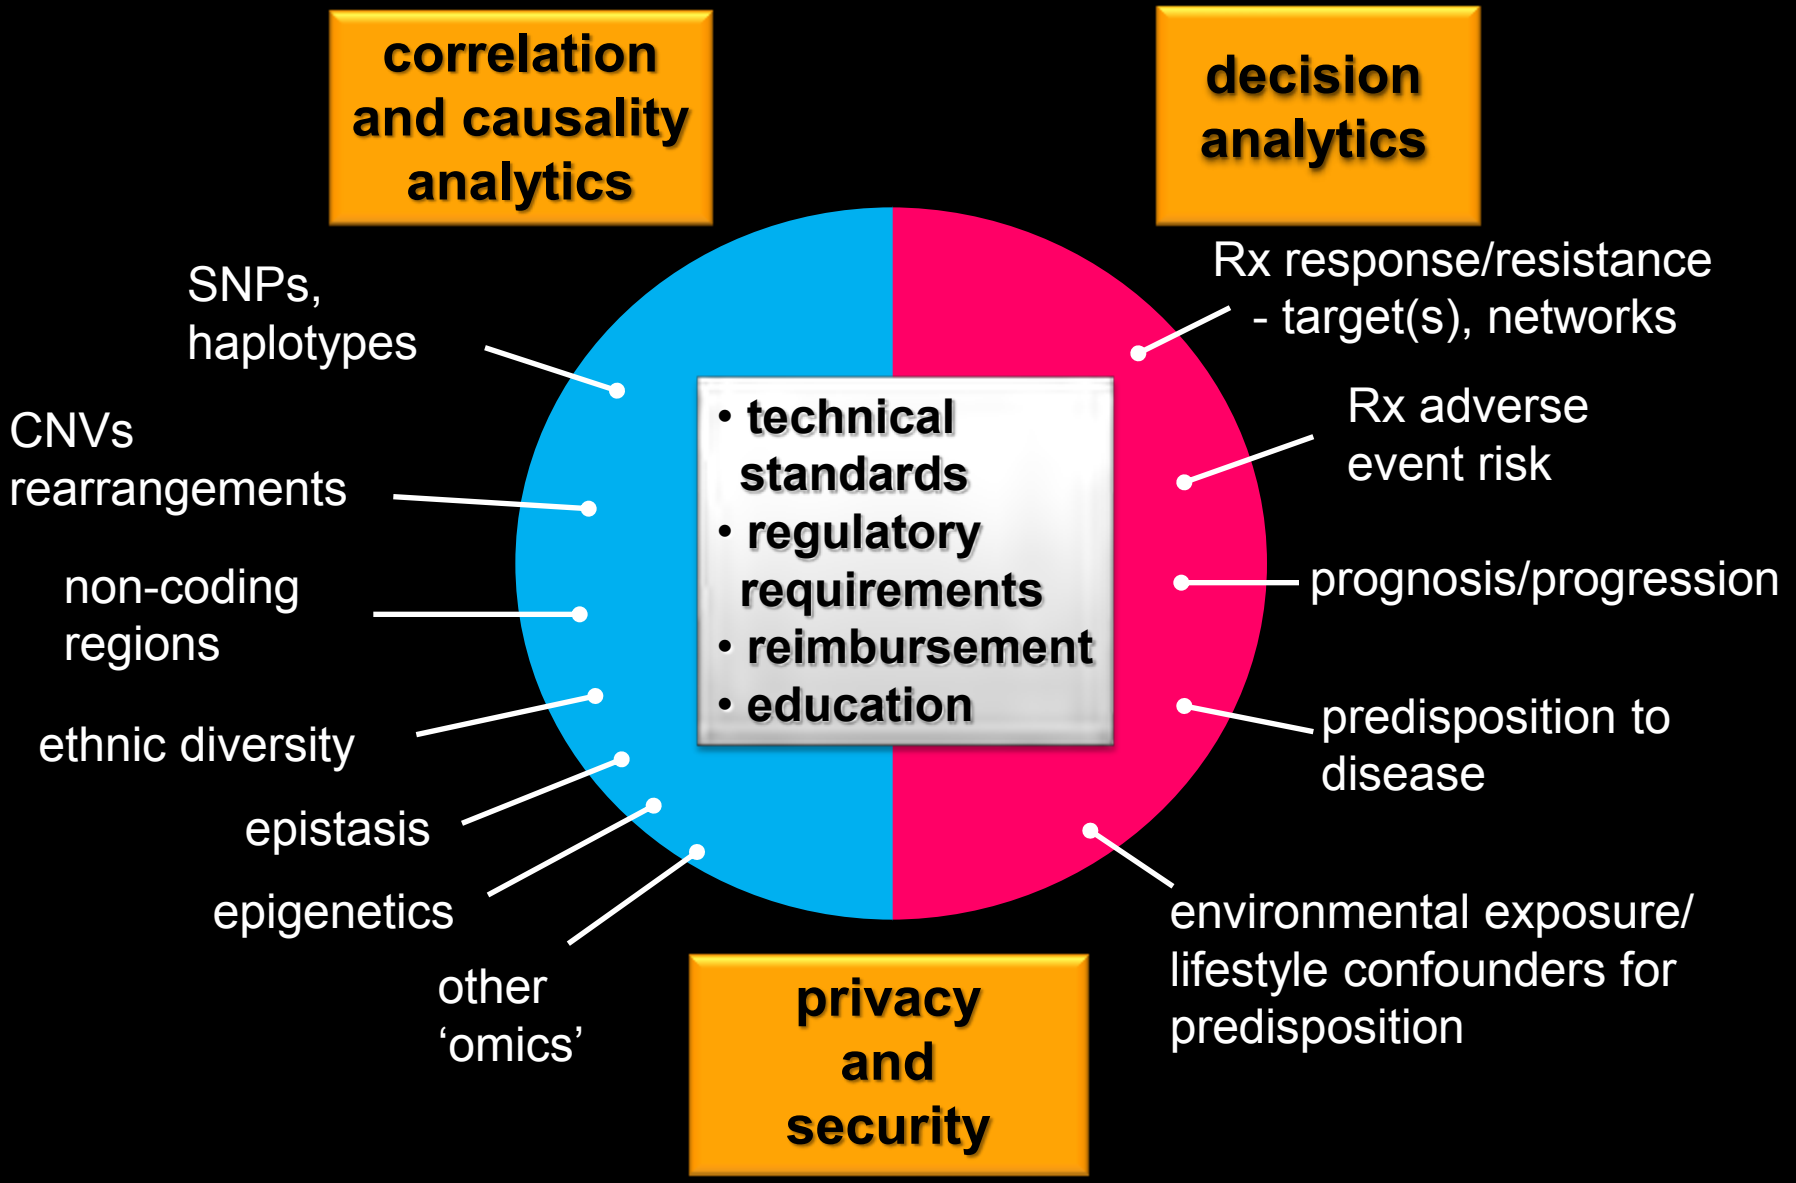
Large Scale Genome Sequencing: Whole Exome Sequencing (WES) and Whole Genome Sequencing (WGS)

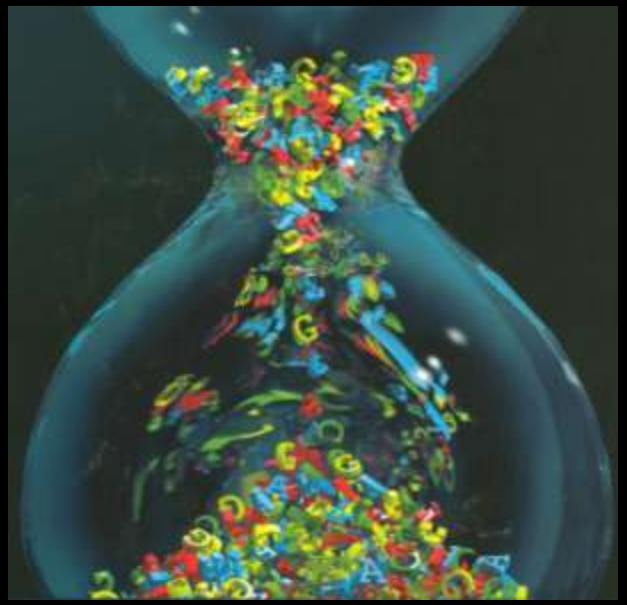
- from research odysseys to a routine clinical tool ("just another lab value!")
- early clinical applications
  - rare diseases of suspected genetic etiology
  - hereditary cancers and individual risk assessment
  - HLA profiling for transplant matching
  - oncology
  - infectious diseases
  - cardiomyopathy
  - X-linked intellectual disability
  - congenital muscular dystrophy
  - mitochondrial disorders

Low Cost Whole Genome Sequencing and Molecular Medicine: Dependency on Large Scale (Massive) Data Annotation and Analytics



What Is A Complete and Accurate Analysis of Genome Sequence, Architecture, Topology and Genomic Regulatory Networks?

Current Chokepoints and Challenges in Adoption of Personal Omics Profiling Data for Clinical Decisions



- production of sequencing data outstripping interpretational capacities
- CLIA compliance and other regulatory requirements for clinical decisions
- confusing maze of base calling, alignment, assembly and analysis tools
- many software tools insufficiently robust and/or customized for one type of data or sequencing platform
- variation in clinical significance predictions from different algorithms using well known algorithms (SIFT, PolyPhen, LRT, MAPP, VarioWatch)
- (comparable data standardization/ validation problems in large scale proteomics)

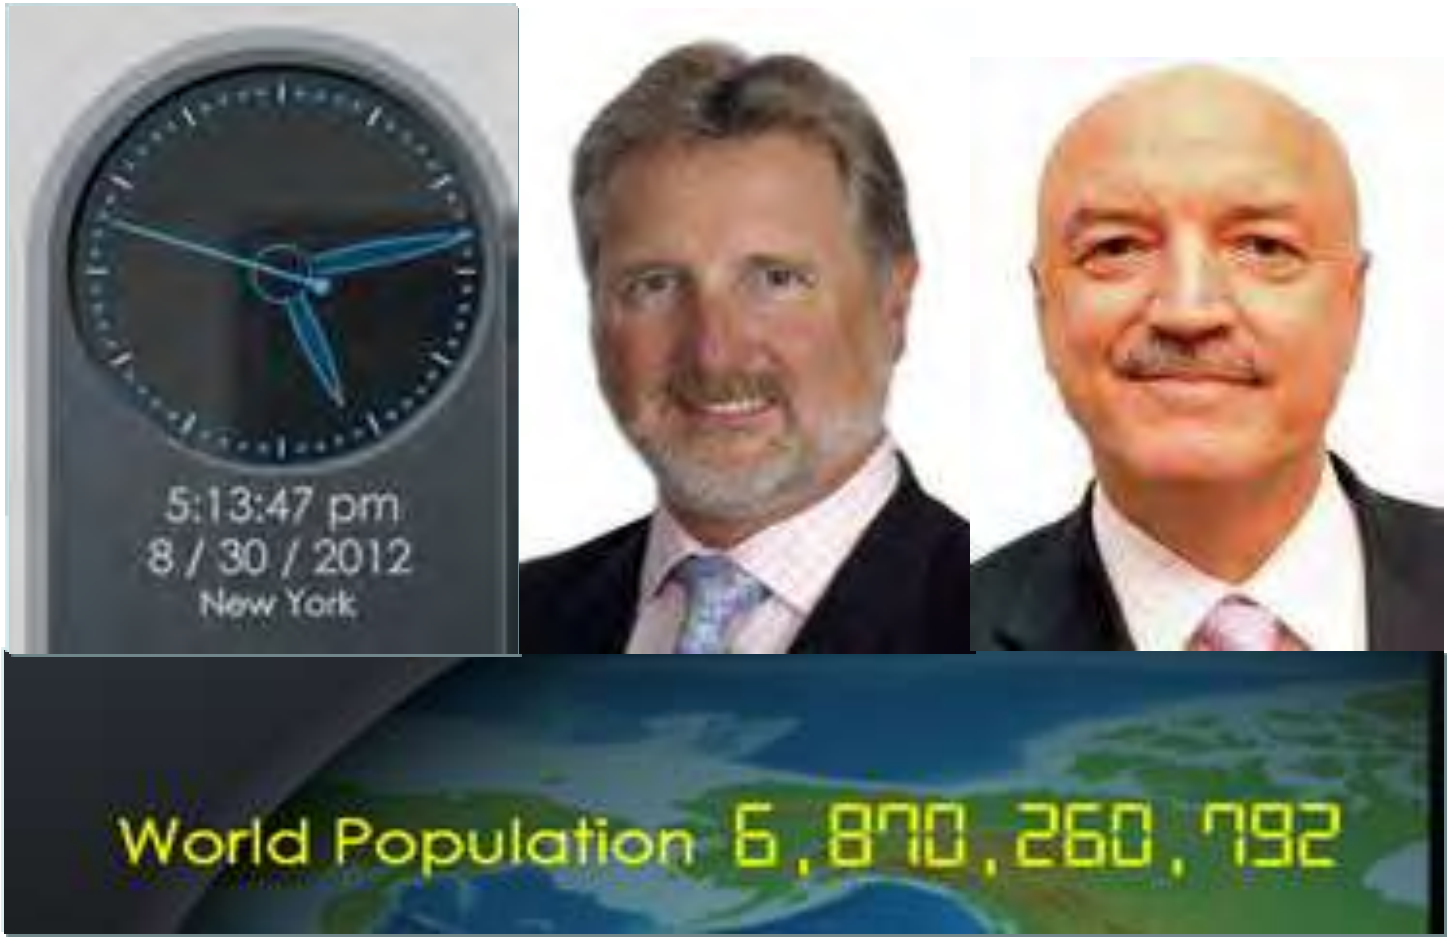
The Imperative for Regulatory Clarity Regarding Test Classification and Analytical Standards for Molecular Diagnostics and WGS

- regulatory classification as LDTs vs. 510(k)/PMA submission?
- sequencers as Class III devices?
- FDA enforcement of Quality Systems Regulations (QSR; 21CFR820)
  - laboratories and suppliers
  - already imposed on medical device industry and FDA-cleared IVD products
- concern over QA for RUO reagents not manufactured using QSRs
  - action to forbid RUO materials when QSR-grade available
- need for Certified Reference Materials with high-level QA and traceability
  - Genome in a Bottle Consortium (2012)

IHE-LAW
A Major Advance for Integration of Diagnostic Laboratory Automation, Information Systems and Electronic Health Records

- partnership between Integrating the Healthcare Enterprise (IHE) and In Vitro Diagnostics Connectivity Consortium (IICC)
- IHE-LAW (Laboratory Analytical Workflow) standard
  - uniform IT connectivity standards for LIS, automation systems, middleware, CPOE and EHR
  - use of ISO HL7 messaging
- participation of leading instrument manufacturers
  - Abbott, BD, Beckman Coulter, BioMerieux, Ortho, Roche, Siemens
- projected final standard in collaboration with The Clinical and Laboratory Standards Institute (CLSI) in 2013

Mapping Individual Genome Variation and Patterns of Disease Risk and Progression



Genes For …..

The Overtly Simplistic and Deterministic Dangers of a Genome-Sequence Centric Perspective

Individual Variation, Genome Complexity and the Challenge of Genotype-Phenotype Predictions

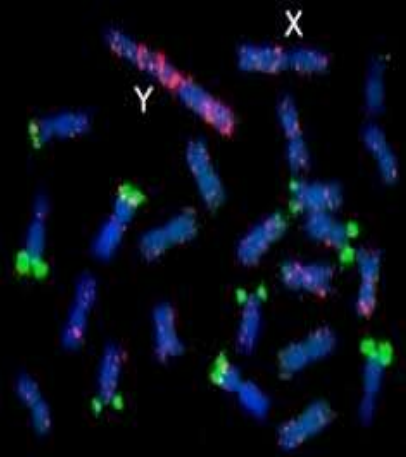
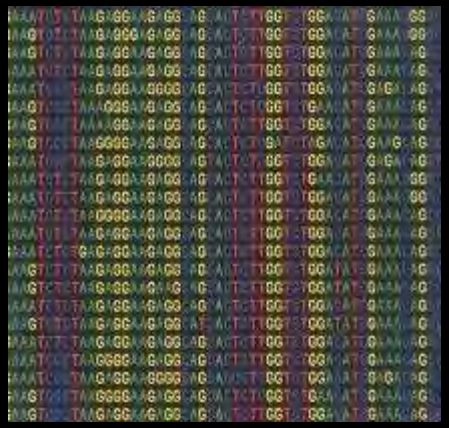
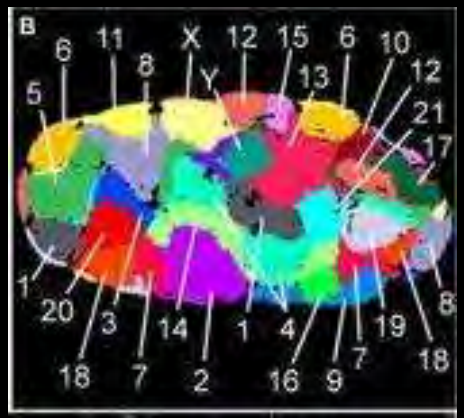
Genomes, Genetics and Individual Variation: From Elements to Networks

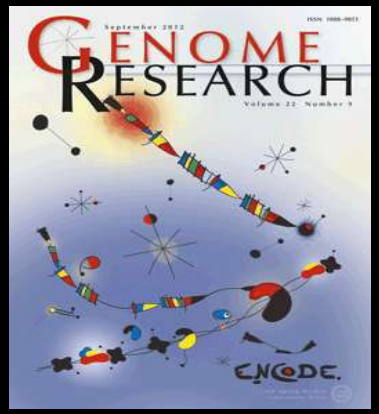
Unidimensional toponymy and local regulation of linearly ordered genes (flat genome)





topology of precision chromosome localization and folding (nuclear space) and global choreography via extensive networks of long-range *cis*-interactions (3-D genome)





The Human Genome (ENCODE 2012): Daunting Complexity

- protein-coding DNA = c.1.5% gnome= 20,687 protein-coding genes
- pervasive transcription
  - 93% bases transcribed into RNA
  - 18,400 non-coding RNA genes
  - 70,000 promoter regions, 400,000 enhancer regions
  - diverse transcription and (co)splicing processing patterns
- 11,244 DNA pseudogene regions with variable transcription
- 42% DNA accessible at 3.0 million sites for interaction with regulatory elements
- complex 3-D topology
  - average 3.9 distal (long range) DNA regions link with beginning of each gene

The Scale and Complexity of Human Genome Variation

- individual genomes on average carry:
  - 3.5 -4.0 million SNV, 1000 CNVs (>450bp)
  - 3-4 hundred indels
  - 200-500,000 private SNV
  - 20-400 loss-of-function variants
- estimated up to 60 new inherited mutations/generation
  - gender dependent transmission: maternal 15/paternal 25-45
  - impact of paternal age at fertilization

Mapping Human Genome Variation and Identification of Causal Variants for Disease

- both causal and protective alleles
- hypotheses
  - small number of common variants with large effects
  - large number of common variants with small effects
  - large number of rare variants with small effects

plus

- role of environmental and epigenetic influences

The Relationship Between Allele Frequency and Effect Size and The Lack of Intermediate Frequency Associations

Distal (paleo-) ancestors

clan

pedigree

individual

epigenetics

rare/private

in utero and post-natal environmental effects "exposome"

parental age at reproduction

Regulatory DNA Domains as Major Source of Minor Frequency Causal Disease Variants

- disease-and trait associated SNP variants are concentrated in regulatory DNA
  - modify transcription factor recognition
  - alter allelic chromatin states
- impact of early gestational exposure and post-natal environmental insults on chromatin landscape and regulatory DNA
  - fetal origins of disease hypothesis
  - depletion of ‘fetal-type’ DHSs in aging-related disease, cancer, inflammatory disorders

Implications of Role of Rare/Private Variants in Disease for Identification and Validation Studies

- very large sample sizes (logistics, cost)
- replication of findings across different populations (ethnicity, geographic history) will be limited
- renewed focus on clan: pedigree cohorts to identify "recent" disease causal variants not yet purged by negative selection
- large scale data analytics on random cohorts may be less productive
- cancer presents unique challenges
  - extravagant scale of causal somatic mutations plus rapid progression of intra-and inter-lesional heterogeneity in advanced disease

Mapping Human Genetic Diversity: Transcending Political Correctness and Denial of Biology

- non-trivial genetically-based biological variation exists in individuals and groups
- ignoring such variations is illogical, poor science, poor clinical medicine and potentially dangerous
- mapping group genetic diversity is fundamental knowledge
  - human evolution and trait acquisition
  - interplay of genomes and environment in determining outcomes
  - variations in disease susceptibility, xenogeneic metabolism and clinical decisions for optimum treatment

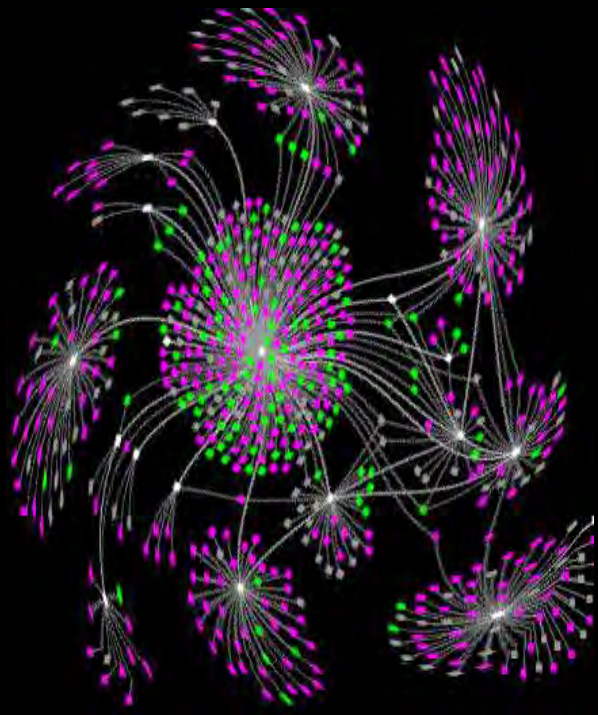
The Design and Validation of Facile Browsers for iPOP Data

Science (2012) 337, 1190

Systematic Localization of Common Disease-Associated Variation in Regulatory DNA

Matthew T. Maurano,[1*] Richard Humbert,[1*] Eric Rynes,[1*] Robert E. Thurman,[1] Eric Haugen,[1] Hao Wang,[1] Alex P. Reynolds,[1] Richard Sandstrom,[1] Hongzhu Qu,[1,2] Jennifer Brody,[3] Anthony Shafer,[1] Fidencio Neri,[1] Kristen Lee,[1] Tanya Kutyavin,[1] Sandra Stehling-Sun,[1] Audra K. Johnson,[1] Theresa K. Canfield,[1] Erika Giste,[1] Morgan Diegel,[1] Daniel Bates,[1] R. Scott Hansen,[4] Shane Neph,[1] Peter J. Sabo,[1] Shelly Heimfeld,[5] Antony Raubitschek,[6] Steven Ziegler,[6] Chris Cotsapas,[7,8] Nona Sotoodehnia,[9,9] Ian Glass,[10] Shamil R. Sunyaev,[11] Rajinder Kaul,[4] John A. Stamatoyannopoulos[1,12]†

Genome-wide association studies have identified many noncoding variants associated with common diseases and traits. We show that these variants are concentrated in regulatory DNA marked by deoxyribonuclease I (DNase I) hypersensitive sites (DHSs). Eighty-eight percent of such DHSs are activ during fetal development and are enriched in variants associated with gestational exposure–related phenotypes. We identified distant gene targets for hundreds of variant-containing DHSs that may expl phenotype associations. Disease-associated variants systematically perturb transcription factor recogniti sequences, frequently alter allelic chromatin states, and form regulatory networks. We also demonstra tissue-selective enrichment of more weakly disease-associated variants within DHSs and the de novo identification of pathogenic cell types for Crohn's disease, multiple sclerosis, and an electrocardiogram trait, without prior knowledge of physiological mechanisms. Our results suggest pervasive involvemen regulatory DNA variation in common human disease and provide pathogenic insights into diverse disord



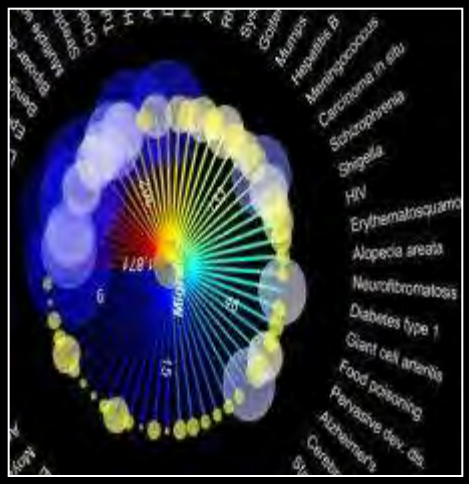
Causal Disease Variant Association (What)

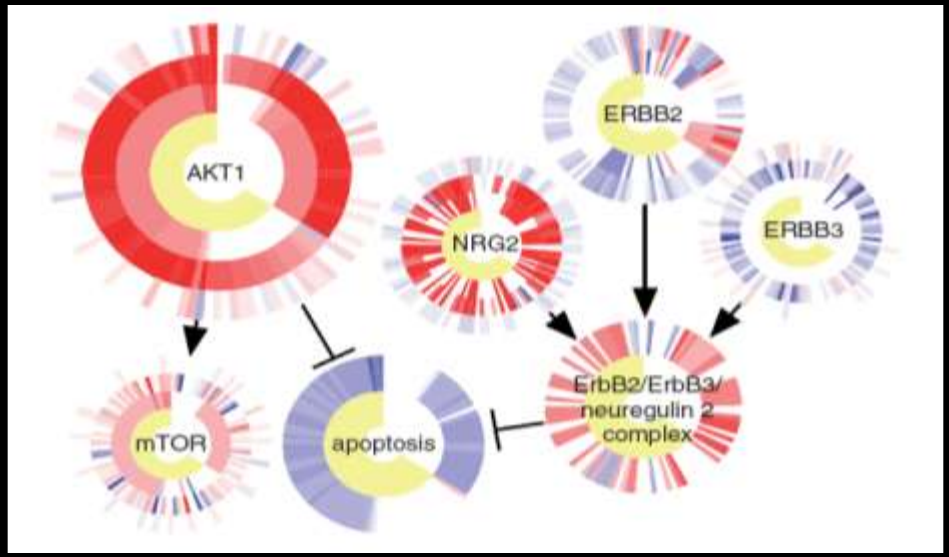
Variants to Network Perturbation (How)

The Design and Validation of Facile Browsers for iPOP Data

- V3: variety, volume, velocity
- data standards, quality and provenance
- interoperable formats and integration of diverse data feeds
  - from omics catalogs (research/clinical trials) to outcomes (clinical, epidemiological) and optimum care decisions
- new visualization tools for mapping and interactive analytics
  - from 1-D to 3-D genomes to dynamic networks
  - dynamic time series data to track individual health status and population disease risk burden

Integration of Omics Data Into Electronic Health Records and Clinical Decisions





Informatics and High Performance Computing

- interactive modeling and simulation of hierarchical omics networks of complexity
  - point-and-click analytics
  - super-scalable

- development of new mathematical, statistical and computing tools for analysis and modeling of non-linear phenomena in complex networks

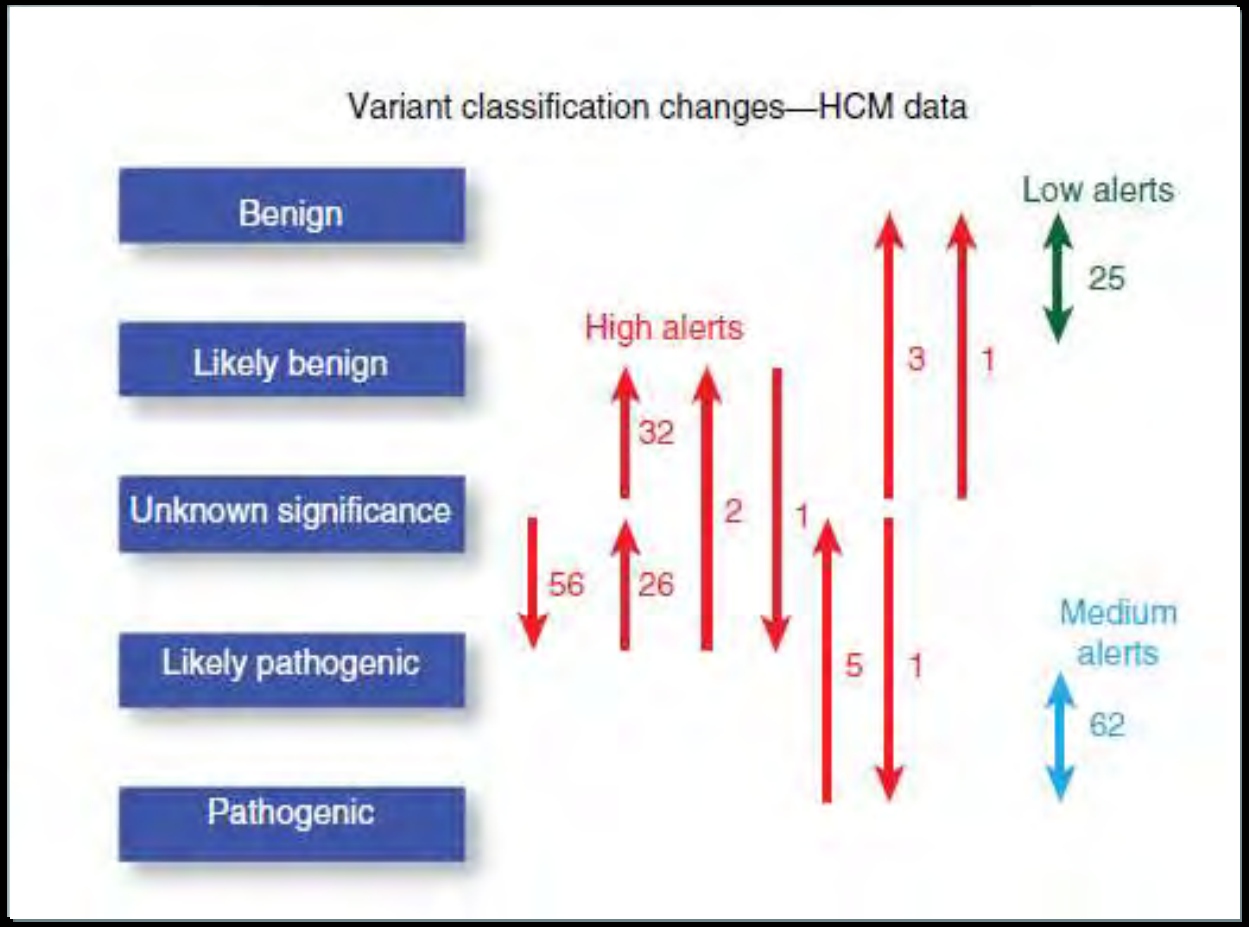
- application of advanced machine learning tools, avatars, robots and automated data production suites for customized data to promote optimum decision-actions

Molecular Medicine:
Genotype-Phenotype Correlations for Improved Clinical Care

Managing "The Incidentalome"

- identification of incidental disease risk factors during clinical omics profiling for a different purpose
- evidentiary standards and decision thresholds for follow-up/recontact research participants
- duties/obligations to recontact/reprofile based on new knowledge?
- consented vs. non-consented follow-up
- obligations to inform extended biological pedigree of serious risk(s)
- declining guarantees for anonymity, privacy and confidentiality

214 Changes Over Seven Years in Risk Classification for Hypertrophic Cardiomyopathy (HCM) Risk Variants on 11 Genes on HCM CardioChip Test*

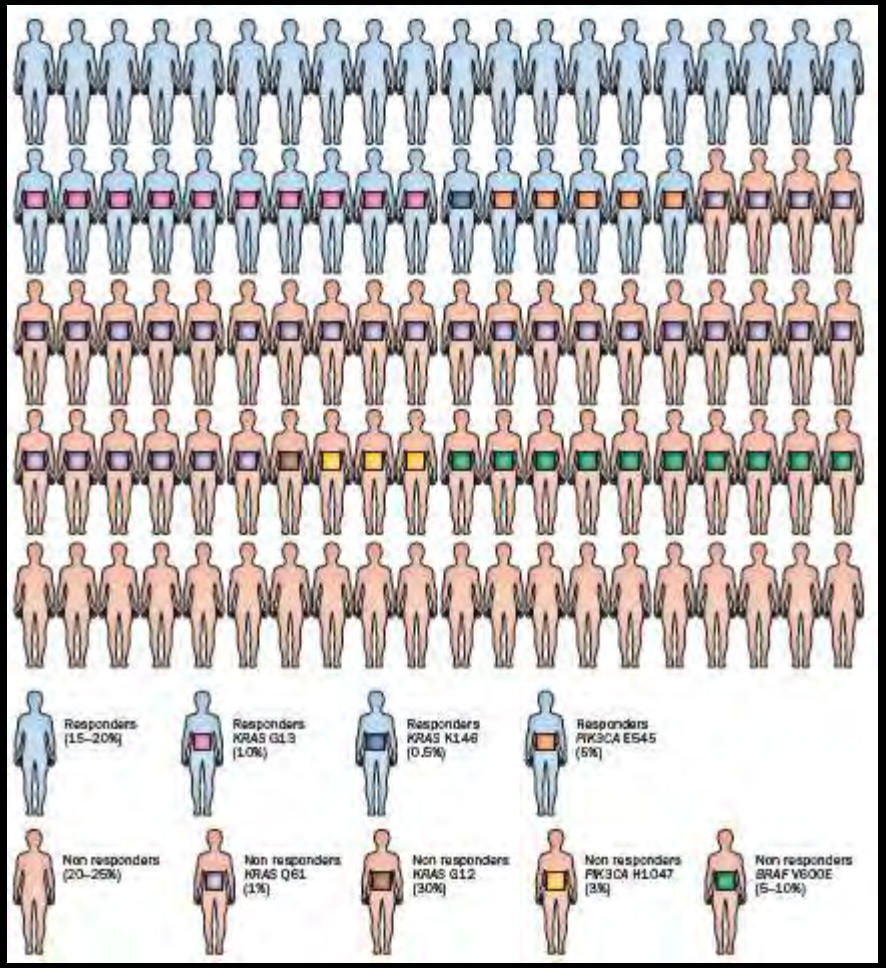


*S. J. Aronson et al. (2012) Genetics in Medicine 14, 713
Partners Health Care HCM Knowledge base: 1472 variants, 2279 family members, 4923 tests

Individual Genetic Variation, Disease Subtypes and Prospect of New Categories of 'Orphan Diseases'

Common Diseases: Are There Any?

Frequencies of Molecular Alterations in CRC and Responsiveness to Cetuximab or Panitumumab



From: M. Martini et al. (2012) Nature Rev. Clin. Oncol.

Molecular Diagnostics and Identification of Responder/Non-Responder Patients for Rational Rx

"The problem with all these (MDx subtyping) tests,
soon I'll have nothing
I can offer my patients"

"Eminent Oncologist" (journal designation)
Drug Discovery World. Spring 2011, p. 61.

Large Scale Profiling of Cancer Patients to Identify Cohorts Expressing Low Frequency Rx Target(s) for Phase II Trials

Target	# Patients Screened	# Eligible Patients	# Centers	# Countries
EML4 ALK^{+}: lung cancer*	1500	82	9	1
HER2^{+}: gastric cancer**	3803	549	122	24

* E.L. Kwak et al. (2010) NEJM 363, 1693

** Y. Bang et al. (2010) Lancet 376, 687

Pharmacogenetic Profiling (PGx) for Rx Response/Safety

- higher Rx costs for omics- segmented markets to ensure adequate ROI?
- premium pricing for higher efficacy (guaranteed efficacy)?
- inadequate/erratic adoption of PGx testing to date
  - professional and payer knowledge gaps
- predictive value of some PGx tests may be insufficient for widespread clinical utility
- physician obligations to offer PGx test and obligation to use results?
- future liabilities: an evolving legal landscape (see G. Marchant, ASU)
  - physicians, pharmacists, companies, payers

Reimbursement for Molecular Profiling Tests

- uncertainty regarding data requirements
- CMS still relies on the same (and undefined) "reasonable and necessary" coverage threshold
- increasing payor adoption of non-payment "refuge" on the need for "practice-based evidence"
  - observational studies, pragmatic trials
- asynchrony between FDA approval and CMS coverage (CED solution?)
- preliminary decision by CMS (9/4/12) to place MDx in clinical laboratory fee schedule versus physicians pathology services classification (20% co-pay problem)

CPT (Current Procedural Terminology) Manual of the AMA

- CPT 5-digit classifier codes: established 1970, updated annually
- 2010 CPT handbook only contained 20 codes for genetic tests and process-focused (PCR, FISH….)
- new 2012 handbook
  - 100 gene-specific codes
  - 9 Tier 2 ‘buckets’ for other tests
  - difficulty for payors to price differentiate tests of different complexity binned in same bucket
  - currently no allowance for high throughput sequencing
- CPT editorial panel proposal for 2013 manual
  - Multi-Analyte Assays with Algorithms (MAAAs)

The Growing Education and Knowledge Gaps in Comprehension of Molecular Medicine Concepts Among Healthcare Professionals

Overcoming Gaps in Physician Knowledge of Molecular Medicine and a Paper-Centric Healthcare System

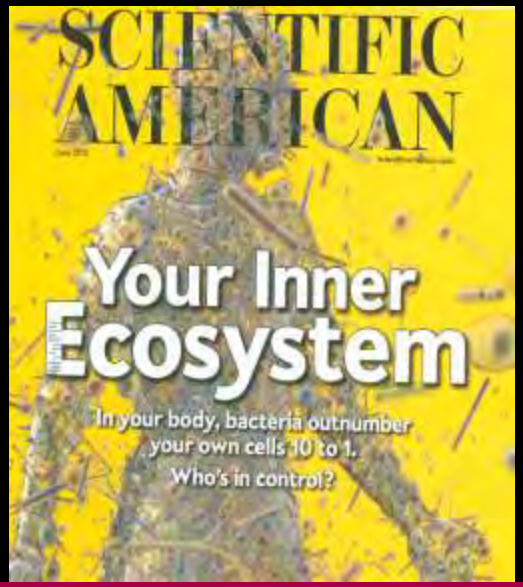
- 90% of Americans lack confidence in their clinicians ability to understand and use genetic information
  - http://www.cogentresearch.com/news/Press%20Releases/CGAT_2010
- professional cultural vulnerability/reluctance to acknowledge
- refuge in outdated SOC/guidelines that fail to integrate much new molecular profiling data
- protracted deliberations by professional societies/boards
- less than 4% of 8967 ACGME programs relate to genetic expertise (JAMA 2011 306, 1015)
- MD curriculum/CME challenges
- generational gap in IT use/facileness and resistance to computerized decision-support tools

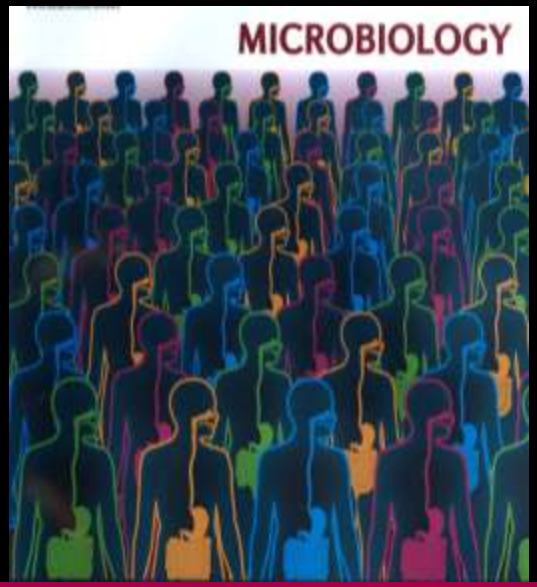
The Clinical Void in Understanding Laboratory Diagnostic Tests

"We don't teach (medical) students how to interpret lab results or how to pick them.
We're spending 61 to 302 hours in anatomic pathology and nine hours teaching laboratory medicine.
To pass anatomic pathology you've got to pass a test. There are no tests for lab. medicine."

Dr. M. Laposta MD. Ph.D.
Executive Vice-Chair of Pathology, Microbiology and Immunology
Vanderbilt Univ. School of Medicine
Member, CDC Clinical Laboratory Integration Into Healthcare Collaborative (CLIHC)
Clin. Lab. News. (2012) Sept. p. 2

We Are Not Alone: Variation in the Human Microbiome as a Potential Factor in Health and Disease





The Metagenomics and Complex Ecology of the Human Microbiome

- extravagant microbial diversity
- complex microbe-microbe ecology and microbiota-host interactions
  - large scale sequencing and meta-analytics
- profiling the ‘healthy’ microbiome (age, gender (pregnancy) site-specific, geopgraphy, diet)
- dysbiosis and complex disease: cause or consequence?
  - characterization of role of emergent pathobionts (dysbiosis) in systemic disease
  - allergy/asthma, diabesity, metabolic disease, chromic inflammatory diseases?
  - aging and frailty?

Transition in Microbiota Composition from Community-(Left) to Long-Stay Facilities (Right) Mirrors Transition from Health (Green) to Fraility (Red)

Moving Downstream Beyond Discovery:
The Escalating Scale and Complexity of the Data Stream

Driving iOmics and Molecular Medicine and IT-Centric Capabilities Into Routine Clinical Practice

Silos, Turf and Cultural Conservatism as Barriers to Change

Biomedical R&D and Clinical Medicine: An Unavoidable Transition to Data-and Computation-Intensive Methods

Current Era

- an opinion-rich, robust information content-poor world
- "silos" of research/clinical activities
- proliferation of poorly standardized and fragmented data, semantic anarchy and incompatible databases
- unacceptable levels of inaccurate diagnoses, fragmented care provision and flawed clinical decisions
  - highly variable treatment practices and erratic clinical outcomes
- extravagant waste and risk

Biomedical R&D and Clinical Medicine: An Unavoidable Yet Essential Transition to Date- and Computation-Intensive Processes

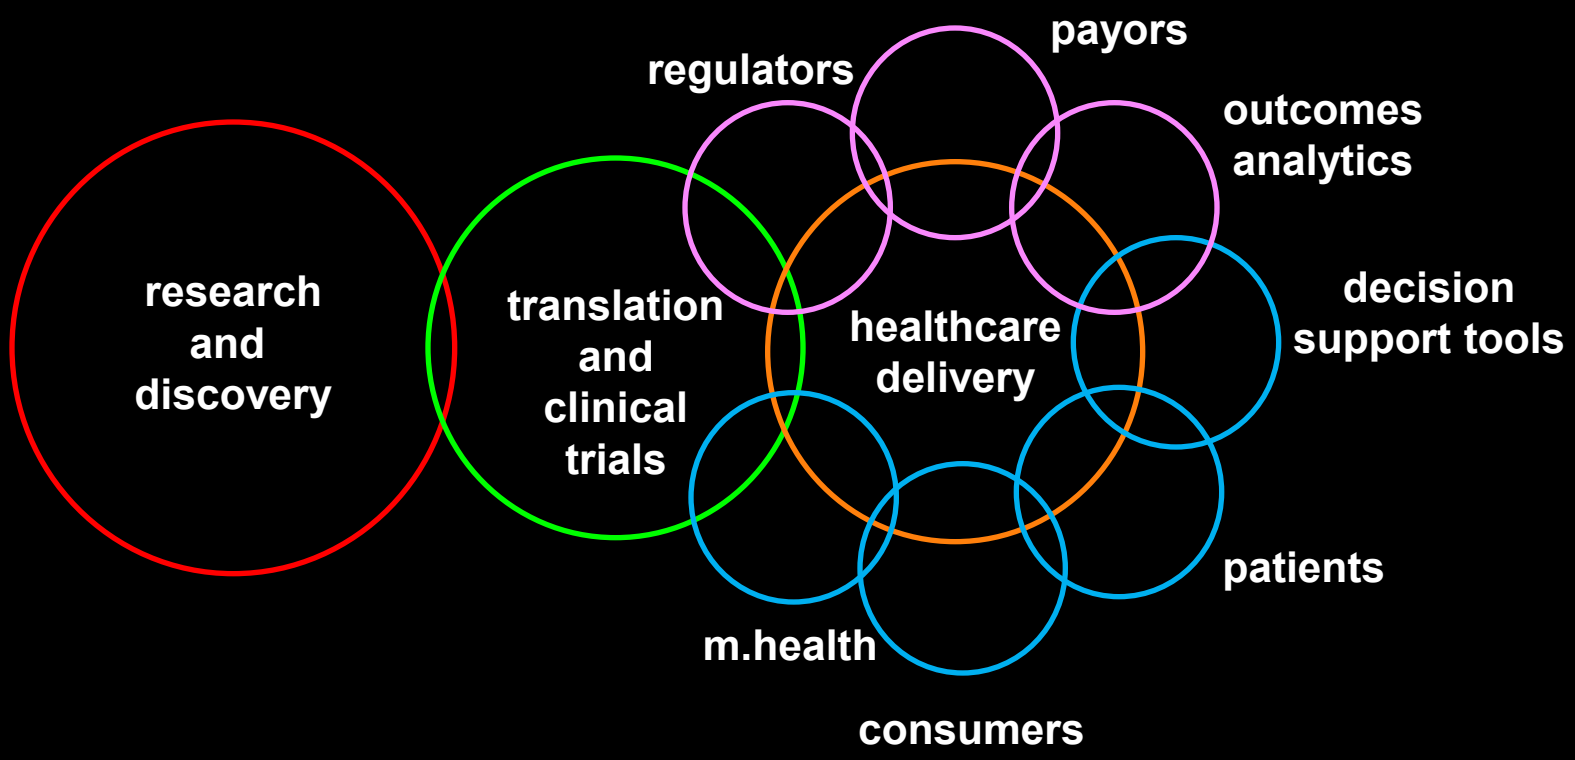
Pending Era

- massive data (big data)
  - V3: volume, velocity, variety
  - automated, massively parallel 'omics' profiling (research and clinical)
- diversification of data streams and cross-sector convergence
  - biomedicine, engineering, computing, telecommunications, social media
- new formats for data acquisition, validation and curation
- facile cross-disciplinary/cross sector dbase interoperabilities
- new machine-based analytics for management of mega-data, customized distribution and decision-support

Managing Big Data in Biomedicine is Not a Simple Extrapolation from Current Practices

Radical and Disruptive Changes Await!!!

The Need for Facile, Seamless Data Exchange Formats for Large Scale Biomedical Data Systems



Representation of Datasets and Abstractions

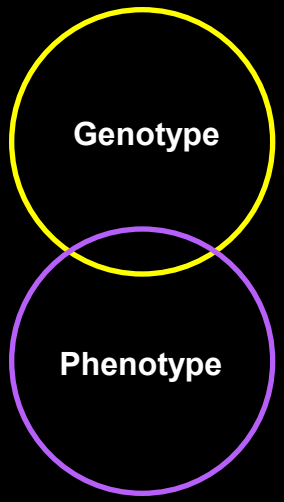
Discovery

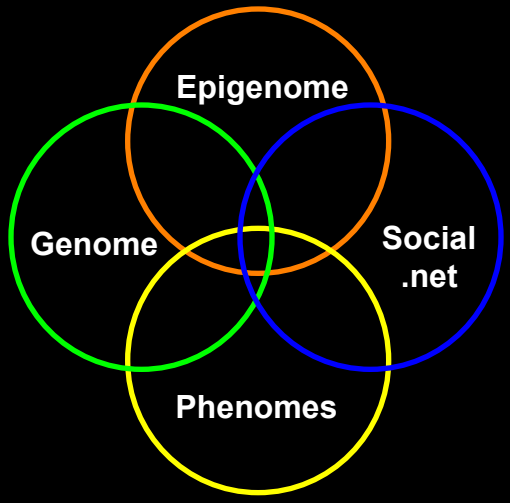
- controlled vocabularies and formal ontologies
- minimal information checklists and open source repositories
- algorithms and source code for analytical tools

Translation and Adoption in Routine Care

- exchange formats and semantic interoperability
- cross-domain harmonization/integration/migration/sharing
  - community-driven (eg. SMBL.org, BioSharing catalogue), industry-driven (eg. Pistoia Alliance), regulatory-driven (eg. CDISC), clinical (eg. HL7)
  - reimbursement (CPT, ICD) and HITECH EMR/MU
- consent, privacy, confidentiality, security
- meta-data tools
- machine-based natural language processing and decision support algorithms

Rich Data Will Drive Clinical Profiling to 'Interpreted Phenotypes'





Observed Phenotype	Interpreted Phenotype and Phenomes

NUANCE®

The Pending Zettabyte Era

1,000,000,000,000,000,000,000

The Emergence of Large Scale, Integrated Data and Knowledge Networks:

Profound Consequences for Individuals, Enterprises, Infrastructure Investment and Governments

The Tianhe-BGI Bioinformatics & Computing Laboratory

- 14,336 Xeon X5670 Processors
- 7,168 Nvidia Tesla M2050 general purpose GPUs
- 2,048 FeiTeng 1000 SPARC-based processors
- 2.57 petaflops per second performance

Key Principles in an Era of Data-Intensive Biomedical Computing

- increasing fraction of data is ‘born digital’
- more and more data is now networked and increasingly open
- ever larger data sets become increasingly unmovable with existing infrastructure
- modeling and simulations using big data and meta-analytics will amplify the data metaverse

Data-Driven Knowledge, Intelligence and Actionable Decisions

- changing the nature of discovery
  - hypothesis-driven versus unbiased analytics of large datasets (patterns, rules)
- changing the nature of explanation
  - statistical probabilities versus unitary values
- changing the cultural process of knowledge acquisition
  - large scale collaboration networks, open systems, social media
- changing the cognitive frameworks and intellectual competencies for knowledge-intensive competitiveness in multiple domains

Board on Higher Education and Workforce Policy and Global Affairs

2011

- **by 2018 the US will need 160,000 more individuals with expertise in statistical methods and data analytics**

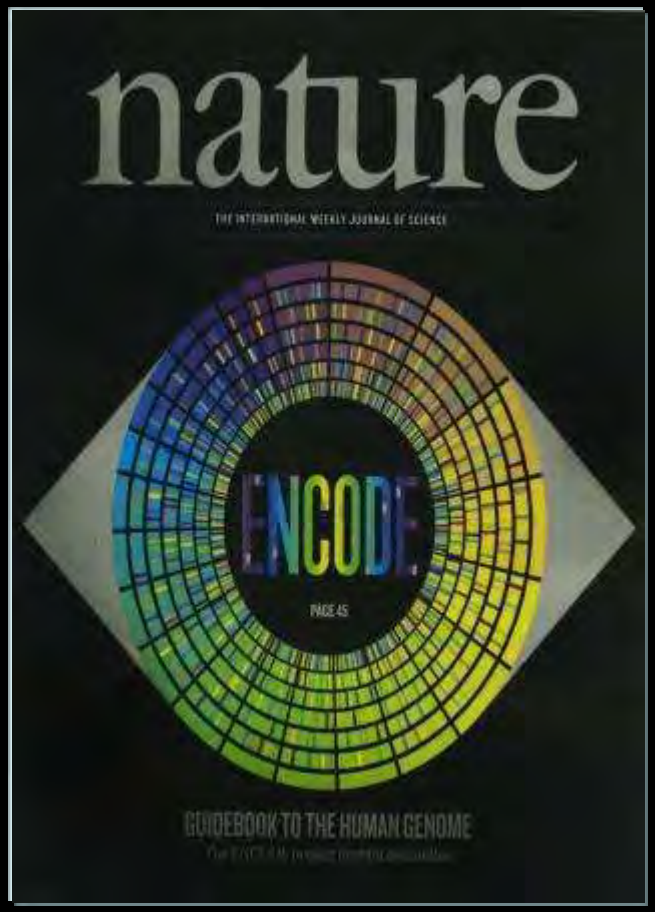
R.N. Rodriguez
President-Elect, American Statistical Association
Non-Clinical Biostatistics Conference, Boston 19 Oct. 2011

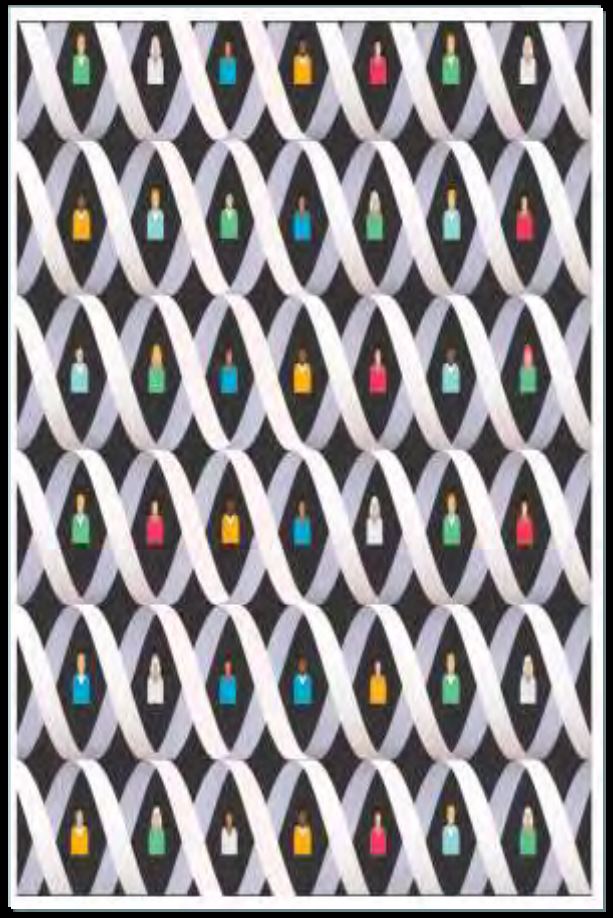
Consortium Science:Big Science

- biomedicine lags other fields of science and technology
  - engineering, materials science, computing, physics, astronomy, ecology, climate modeling
- big science antithetical to traditional organizational structures and career rewards in academic life sciences
- slow adaptation of public funding agencies to shift from individual-investigator to team-based science and enforce standards demanded by translational research
- '3M' projects: multi-investigator, multi-institution, multi-million
- increasing role of private public partnerships (3P) and pre-competitive consortia

Sustaining Relevance and Competitiveness: The Academy Must Engage With Real World Problems

Big Data Projects in Omics: Logistical, Organizational and Cultural Challenges





- ENCODE
  - 10 year effort
  - $288 million
  - 442 Doctoral-level researchers in 2012 publications

EURO-BIOIMAGING

The Sociology of Integration of Computational Science as a Core Component of Biomedical R&D

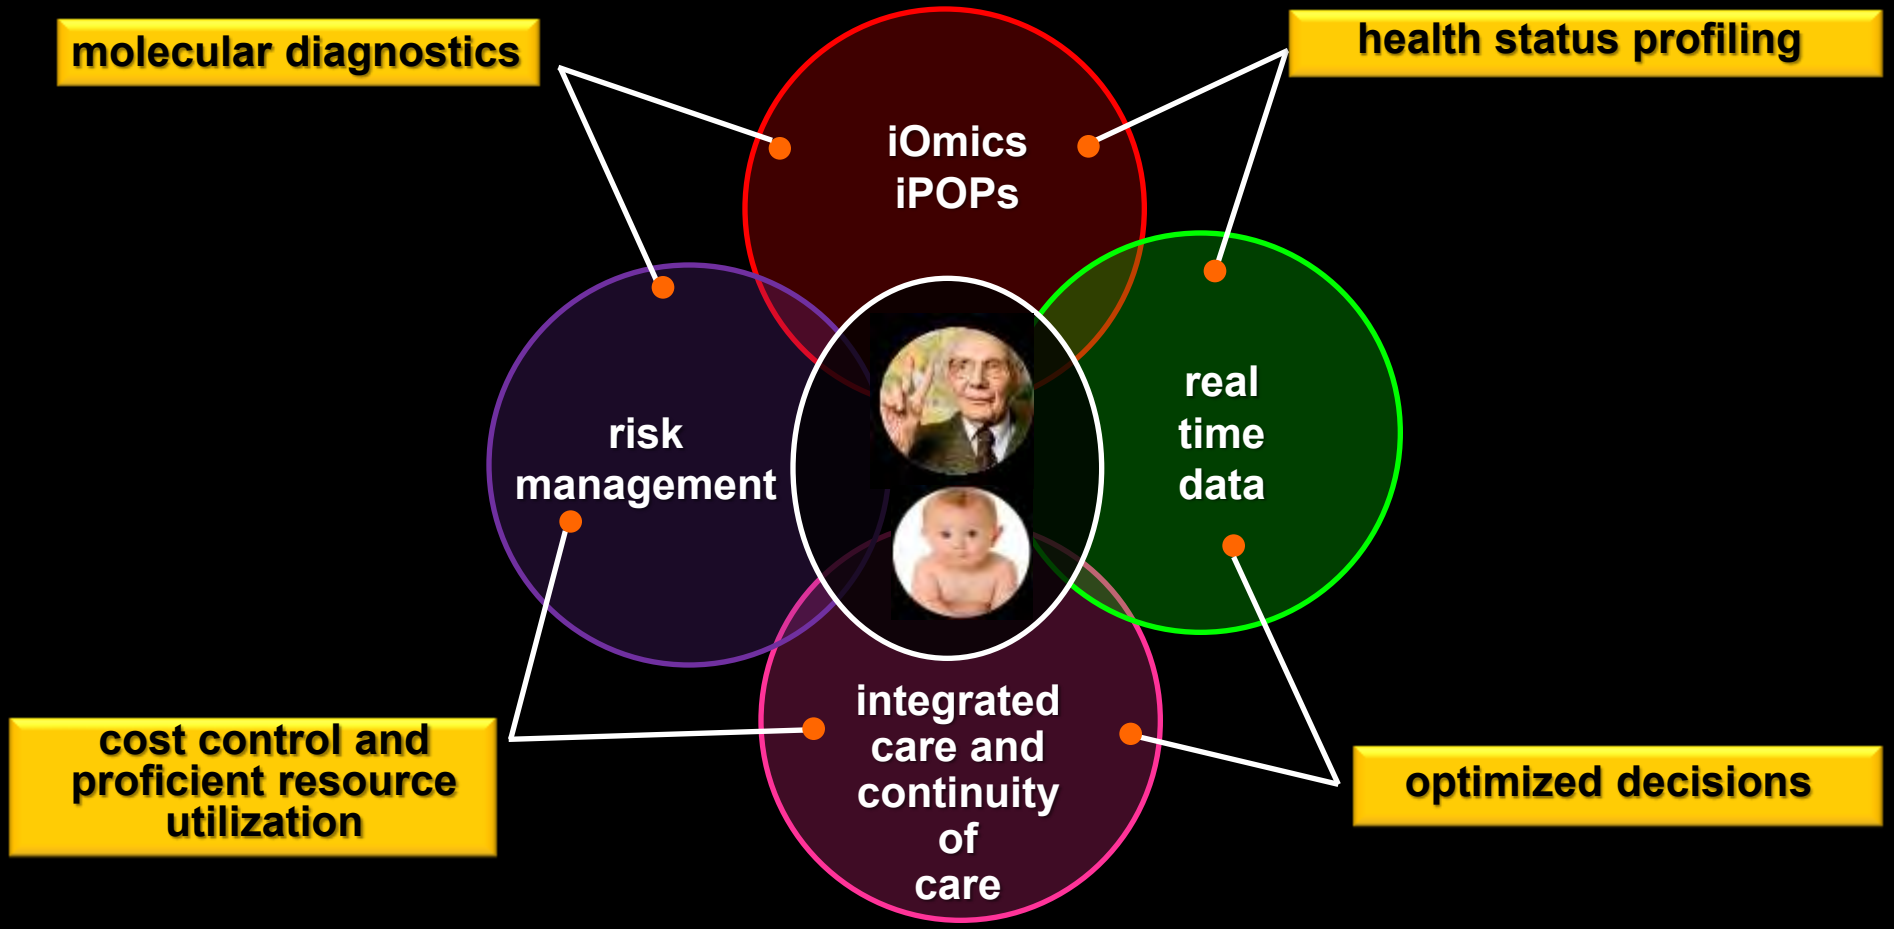
- bridging three cultures
  - biomedical specialities, software engineering and scientific computing
- new ‘hybrid’ competencies/specialities
- building sufficient expertise (individuals/communities)
  - training, funding, incentives, rewards
- designing workflows and interfaces for e.science and federated virtual research environments
- increasing dependence/contribution on open-source datasets
- mapping data provenance in large multi-source datasets
- life in ‘the perpetual beta’

- rethink
- recalibrate
- design

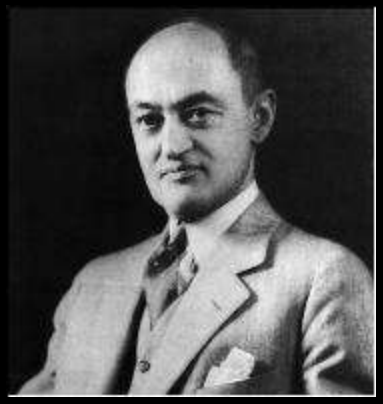
What is required?

What is sustainable?

Integrative Omics (iOmics) and Integrative Personal Omics Profiles (iPOPs) as the Core Foundational Elements for Molecular Medicine

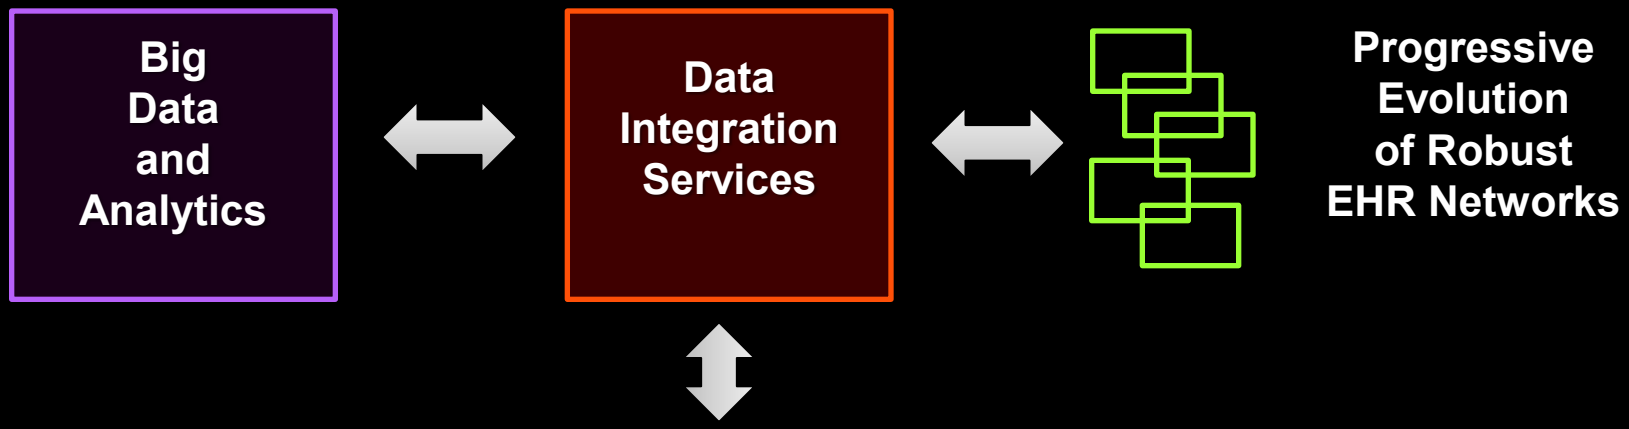


Disruptive Technologies and Creative Destruction



- arise at margins of existing fields
  or
  convergence/fusion interstices of previously separate technical domains/markets
- importance typically denied by KOLs and market leaders with often fatal consequences

iOmics and Computational Biomedicine as Disruptive Technologies for Radical Change in Life Sciences Research and Healthcare



Improved Clinical Risk Assessment, Management and Superior Outcomes

- robust, standardized research data and ontologies
- integrative personal omics profiles
- risk modeling
  - individual
  - population based
- precision diagnosis, monitoring and agile updating of best practice guidelines
- continuity of care
- pre-emptive care
- superior outcomes
- cost control
- improved care, QOL and wellness

Aligning Individual and Societal Needs for Optimum Health
